NextTrack Dashboards—Display Real Time Shop Floor Data

What you can measure, you can improve.

Companies often have some idea of whether or not they are performing well, but how current is the information? Is it based on your last quarterly report, or is it based on what is happening on your shop floor right now?

With Crossroads RMC's NextTrack Dashboard application, executives, supervisors and shop floor employees can all see the same data. Track production status, downtime percent complete, machine status, cycle time, OEE and more.

Features and Functions:

- > Separate Operator and Supervisor views.
- > Operator View – provides information on percent complete, efficiency, machine status, job and part information, and suspend status.
- > Supervisor View – provides a “quick view” of all resources presenting machine status, efficiency, and part information. Double clicking on any resource or choosing from the resource drop down will drill into the operator screen for that resource.
- > Parameter controlled configuration allows for personalization of the dashboard display.
- > Color-coded status indicators of out of range conditions.
